

# ACID ETCH GLASS

Also Known as Frost or Satin Glass

Surprisingly, both images below show the exact same type of glass. The difference in appearance is purely due to lighting.

To help set proper expectations: Acid Etch Glass can appear either with a “mint” tint or a “white/frosted” look depending on the lighting conditions inside the shower.

With **strong lighting**, the glass tends to look more **frosted**.

With **limited lighting**, it takes on a **minty** hue.
